Introduction

Traditional rental services rely heavily on manual procedures — phone-based inquiries, paperwork, and disconnected methods for handling bookings and payments. This often causes limited visibility into item availability, booking conflicts, and inconsistent record-keeping.

The Online Rental Contract Booking & Payment System replaces this fragmented process with a single, centralized web platform. Customers can browse items, check availability, book rental periods, and manage payments online, while rental providers get an administrative dashboard to oversee items, bookings, and reports.

PROBLEM STATEMENT

Manual, Paper-Based Process

Bookings rely on phone calls and paperwork with no digital record of transactions.

Poor Availability Visibility

Customers cannot easily check real-time item availability before requesting a rental.

Booking Conflicts

Overlapping manual bookings lead to double-allocation of the same rental item.

Disconnected Payments

Payment, deposit, and invoicing are tracked separately from the booking itself.

Delayed Contract Management

Rental agreements and returns are handled inconsistently, slowing the process.

Limited Reporting for Providers

Rental providers lack a unified view of items, bookings, and payment status.

ABSTRACT

The Online Rental Contract Booking & Payment System for Rental & Leasing is a web-based application developed to simplify and streamline the complete rental process through a centralized digital platform. Traditional rental services often depend on manual procedures, phone-based inquiries, paperwork, and separate methods for managing bookings and payments — resulting in limited visibility of availability, booking conflicts, and inconsistent records.

The proposed system lets users browse rental items, check availability, select rental periods, and book online, while integrating contract management, payment and invoicing, deposit handling, return inspection, and reviews. An administrative dashboard lets rental providers manage items, monitor bookings, track payments, and view reports.

A structured database securely organizes user, item, booking, contract, and payment details behind a clear, user-friendly interface — reducing manual effort, improving booking accuracy, and increasing transparency for both customers and rental providers.

Core Modules (1 – 3)

Module 1

User Authentication

- Registration & Login
- User Profile

Module 2

Rental Catalog

- Browse & Search Items
- Check Availability
- View Rental Price

Module 3

Booking & Contract

- Select Rental Dates
- Book Item
- Manage Rental Contract

Core Modules (4 – 6)

Module 4

Payment & Invoice

- Calculate Total Amount
- Simulated Payment
- Generate Invoice

Module 5

Return & Reviews

- Return Rental Item
- Manage Deposit & Late Fee
- Ratings & Reviews

Module 6

Admin Dashboard

- Manage Items & Users
- Manage Bookings & Payments
- View Reports

Frameworks, Platforms & Software Used

- Frontend: React.js
- Backend: Node.js, Express.js
- Database: MySQL
- Authentication: JSON Web Token (JWT)
- Payment Integration: Razorpay / Stripe
- Email & Notifications: Nodemailer
- API Testing: Postman
- Development Environment: Visual Studio Code
- Version Control: Git & GitHub
- Web Browser: Google Chrome / Microsoft Edge
- Operating System: Windows

Conclusion

Centralized Platform

Booking, contracts & payments in one place.

Less Manual Effort

Automates work once done by phone and paper.

More Transparency

Real-time availability, invoices & status.

Reliable Experience

Accurate records build trust both ways.

"A single centralized platform that makes renting simpler, faster, and more transparent — for customers and providers alike."

Future Scope:

- Live Payment Gateway
- Mobile App
- Analytics & Insights
- Multi-language Support
